This document contains information of proprietary interest to Dynamic Engineering. It has been supplied in confidence and the recipient, by accepting this material, agrees that the subject matter will not be copied or reproduced, in whole or in part, nor its contents revealed in any manner or to any person except to meet the purpose for which it was delivered.

Dynamic Engineering has made every effort to ensure that this manual is accurate and complete. Still, the company reserves the right to make improvements or changes in the product described in this document at any time and without notice. Furthermore, Dynamic Engineering assumes no liability arising out of the application or use of the device described herein.

The electronic equipment described herein generates, uses, and can radiate radio frequency energy. Operation of this equipment in a residential area is likely to cause radio interference, in which case the user, at his own expense, will be required to take whatever measures may be required to correct the interference.

Dynamic Engineering’s products are not authorized for use as critical components in life support devices or systems without the express written approval of the president of Dynamic Engineering.

This product has been designed to operate with IP Module carriers and compatible user-provided equipment. Connection of incompatible hardware is likely to cause serious damage.

Introduction

Pci3Ip, Pci5Ip, cPci2lp, cPci4lp, Pc104plp, Pc104p4lp and PcieCar are Win7 device drivers for their respective PCI/PCIe based Industry-Pack (IP) module carriers from Dynamic Engineering. These drivers were developed with the Windows Driver Foundation version 1.9 (WDF) from Microsoft, specifically the Kernel-Mode Driver Framework (KMDF).

Each carrier can hold 1-5 IP modules (corresponding to the number preceding the Ip designation). When a carrier board is recognized by the system, it will start the appropriate carrier driver, which creates an IP bus to communicate with the IP modules. The carrier driver then enumerates the IP bus by reading the ID prom of each installed IP module to discover the device type. If an IP module is recognized and the carrier has been previously installed, it will be started and a Device Object will be created for each matching IP. If an IP module is not recognized, i.e. the contents of the ID prom do not appear on the list of IP module drivers in the IpCarriers.inf file, the IpGeneric driver will be used to communicate with that IP module.

A separate handle to the IP carrier and to each IP module can be obtained using CreateFile() calls. IO Control calls (IOCTLs) are used to configure the IP carrier and read the carrier’s status. The IP carrier driver is responsible for reading its user switch setting, operating the onboard LED’s, and a few other operations, but the IP carrier’s main function is to act as a PCI/PCIe/IP Bus bridge device providing resources for the installed IP modules. These modules operate independently through their own file handles. See the appropriate IP driver documentation for information on the capabilities of a particular IP module.

Notes

This document will provide information about all calls made to the driver(s), and how the driver(s) interact with the device(s) for each of these calls. For more detailed information on the hardware implementation, refer to the user manual for the specific carrier you are using.

The following terms will be used throughout this document as placeholders for a specific IP carrier driver name. CARRIERNAME: PC104PIP, CPCl2IP, CPCl4IP, PCI3IP, PC104P4IP, PCI5IP or PCIECAR. CarrierName: Pci104plp cPci2lp, Pci3lp, cPci4lp, Pc104p4lp, Pci5lp or PcieCar.

The PcieCar driver controls multiple PCIe based IP carriers. Currently this includes PCle3IP and PCle5IP.
Driver Installation

There are several files provided in the driver package. These files include Pci3lp.sys, Pci5lp.sys, cPci2lp.sys, cPci4lp.sys, Pc104lp.sys, Pc104p4lp.sys, PcieCar.sys, Pci3lpPublic.h, Pci5lpPublic.h, cPci2lpPublic.h, cPci4lpPublic.h, Pc104lpPublic.h, Pc104p4lpPublic.h, PcieCarPublic.h, IpPublic.h, WdfCoInstaller01009.dll, IpCarriers.inf and IpCarriers.cat. The [CarrierName]Public.h files are C header files that define the Application Program Interfaces (API) to the drivers. These files are required at compile time by any application that wishes to interface with the drivers, but are not needed for driver installation.

Note

Several IP carrier drivers are included in the driver package. Since they were all signed together, they must all be present at installation to validate the digital signature.

Windows 7 Installation

Copy IpCarriers.inf, IpCarriers.cat, WdfCoInstaller01009.dll, and all the IP carrier driver files (*.sys) to a removable memory device, or other accessible location as preferred.

With one or more of the supported IP carriers installed, power-on the host computer.

- Open the Device Manager from the control panel.
- Under Other devices there should be a PCI Bridge Other or PCI to NUBUS Bridge device*.
- Right-click on the PCI Bridge Other or PCI to NUBUS Bridge device and select Update Driver Software.
- Insert the removable memory device prepared above if necessary.
- Select Browse my computer for driver software.
- Select Browse and navigate to the location where the appropriate files are stored.
- Select Next. The CarrierName device driver should now be installed.
- Select Close to close the update window.
  The Device Manager should now display the carrier slots that contain valid IP modules.
- Right-click on each IP slot icon, select Update Driver Software and proceed as above for each IP module as necessary.

* If neither of these devices is displayed, click on the Scan for hardware changes icon on the tool-bar or select it in the Action menu.
Driver Startup

Once the driver has been installed it will start automatically when the system recognizes the hardware.

A handle can be opened to a specific board by using the CreateFile() function call and passing in the device name obtained from the system.

The interface to the device is identified using a globally unique identifier (GUID), which is defined in CarrierNamePublic.h.

The main.c file provided with the user test software is designed to work with our test menu and includes user interaction steps to allow the user to select which board is being tested in a multiple board environment. The integrator can hardcode for single board systems or use an automatic loop to operate in multiple board systems without requiring user interaction. For multiple user systems it is suggested that the board number is associated with the user switch setting so the calls can be associated with a specific physical device.
IO Controls

The drivers use IO Control calls (IOCTLS) to configure their devices. IOCTLS refer to a single Device Object, which controls a single module. IOCTLS are called using the Win32 function DeviceIoControl() (see below), and passing in the handle to the device opened with CreateFile() (see above). IOCTLS generally have input parameters, output parameters, or both. Often a custom structure is used.

BOOL DeviceIoControl(
    HANDLE hDevice,            // Handle opened with CreateFile()
    DWORD dwIoControlCode,    // Control code defined in API header file
    LPVOID lpInBuffer,        // Pointer to input parameter
    DWORD nInBufferSize,      // Size of input parameter
    LPVOID lpOutBuffer,       // Pointer to output parameter
    DWORD nOutBufferSize,     // Size of output parameter
    LPDWORD lpBytesReturned,  // Pointer to return length parameter
    LPOVERLAPPED lpOverlapped, // Optional pointer to overlapped structure
);                           // used for asynchronous I/O

The IOCTLS defined in the IP carrier drivers are described below:

IOCTL_CARRIERNAME_GET_INFO

Function: Returns the Driver and Firmware revisions, Switch value, Instance number and number of IP slots supported.
Input: None
Output: DRIVER_CARRIER_DEVICE_INFO structure
Notes: Switch value is the configuration of the onboard dipswitch that has been selected by the user (see the board silk screen for bit position and polarity). The Firmware revision is a 16-bit value; the upper 8 bits are the CPLD revision and the lower 8 bits are the FPGA revision. This field is currently only valid for the PcieCar driver. See the definition of DRIVER_CARRIER_DEVICE_INFO below.

// Driver revision and instance/slot information
typedef struct DRIVER_CARRIER_DEVICE_INFO {
    USHORT DriverRev;
    USHORT FirmwareRev;
    USHORT InstanceNum;
    UCHAR SwitchValue;
    UCHAR NumIpSlots;
} DRIVER_CARRIER_DEVICE_INFO, *PDRIVER_CARRIER_DEVICE_INFO;

IOCTL_CARRIERNAME_GET_SW_ID

Function: Returns the user switch value.
Input: None
Output: Eight-bit switch value (unsigned character)
Notes: The value returned is the user-selected configuration of the 8-bit onboard dipswitch. See the board silk screen for bit position and polarity.
**IOCTL\_CARRIERNAME\_SET\_CONFIG**

**Function:** Specifies various control parameters for the IP carrier.

**Input:** CARRIERNAME\_CONFIG structure

**Output:** None

**Notes:** Specifies the LED configuration and other controls. The configuration parameters for the PcieCar driver are different than the other IP carrier drivers and include interrupt aggregation and de-assert characteristics, LED source and user. See the definition of LED\_MUX, PCIECAR\_CONFIG and CARRIERNAME\_CONFIG below.

```c
// LED source selector
typedef enum _LED_MUX {
    BD_STAT    = 0x0,
    USR_LED    = 0x1,
    USR_SW     = 0x2,
    FLSH_SW    = 0x3,
    IP0_STAT   = 0x4,
    IP1_STAT   = 0x5,
    IP2_STAT   = 0x6,
    RESERVED   = 0x7,
    PST_HD_CRDT = 0x8,
    NPST_HD_CRDT = 0x9,
    CPLT_HD_CRDT = 0xA,
    PST_DT_CRDT = 0xB,
    NPST_DT_CRDT = 0xC,
    CPLT_DT_CRDT = 0xD,
    SCRATCH_0  = 0xE,
    SCRATCH_1  = 0xF
} LED_MUX, *PLED_MUX;

// PcieCar Carrier Configuration
typedef struct _PCIECAR_CONFIG {
    UCHAR UserLed;
    LED_MUX LedSrc;
    BOOLEAN IntAgEn; // Interrupt aggregation timer enable
    UCHAR AgTimer;   // Interrupt aggregation timer
    UCHAR IntDasTme; // Interrupt de-assert time
} PCIECAR\_CONFIG, *PPCIECAR\_CONFIG;

// CARRIERNAME Configuration
typedef struct _CARRIERNAME\_CONFIG {
    UCHAR UserLed; // Configuration of the eight user LEDs
    BOOLEAN BusErrIntEn; // Enable the bus error timeout interrupt
    BOOLEAN BusErrStatClr; // Write clears the interrupt latch/status
} CARRIERNAME\_CONFIG, *PCARRIERNAME\_CONFIG;
```

**IOCTL\_CARRIERNAME\_GET\_CONFIG**

**Function:** Returns the fields set in the previous call.

**Input:** None

**Output:** CARRIERNAME\_CONFIG structure

**Notes:** See the definitions of LED\_MUX, PCIECAR\_CONFIG and CARRIERNAME\_CONFIG above.
IOCTL_CARRIERNAME_GET_INT_STATUS

Function: Returns the IP interrupt status register value and clears the bits that were read.

Input: None

Output: Value of the IP module interrupt status register (unsigned long integer)

Notes: PcieCar: See the status bit definitions below. A bit will be cleared by this call only if it was set when the register was read. This prevents the possibility of missing an interrupt condition that occurs after the register has been read but before the latched bits are cleared.

// PcieCar IP interrupt status defines
#define INTERRUPT_IP0_IREQ0 0x00000001 // Interrupt 0 from IP 0
#define INTERRUPT_IP0_IREQ1 0x00000002 // Interrupt 1 from IP 0
#define INTERRUPT_IP0_BUSERR 0x00000004 // Bus error interrupt from IP 0
#define INTERRUPT_IP0_FORCE 0x00000008 // Force interrupt from IP 0
#define INTERRUPT_IP1_IREQ0 0x00000010 // Interrupt 0 from IP 1
#define INTERRUPT_IP1_IREQ1 0x00000020 // Interrupt 1 from IP 1
#define INTERRUPT_IP1_BUSERR 0x00000040 // Bus error interrupt from IP 1
#define INTERRUPT_IP1_FORCE 0x00000080 // Force interrupt from IP 1
#define INTERRUPT_IP2_IREQ0 0x00000100 // Interrupt 0 from IP 2
#define INTERRUPT_IP2_IREQ1 0x00000200 // Interrupt 1 from IP 2
#define INTERRUPT_IP2_BUSERR 0x00000400 // Bus error interrupt from IP 2
#define INTERRUPT_IP2_FORCE 0x00000800 // Force interrupt from IP 2
#define INTERRUPT_IP3_IREQ0 0x00001000 // Interrupt 0 from IP 3
#define INTERRUPT_IP3_IREQ1 0x00002000 // Interrupt 1 from IP 3
#define INTERRUPT_IP3_BUSERR 0x00004000 // Bus error interrupt from IP 3
#define INTERRUPT_IP3_FORCE 0x00008000 // Force interrupt from IP 3
#define INTERRUPT_IP4_IREQ0 0x00010000 // Interrupt 0 from IP 4
#define INTERRUPT_IP4_IREQ1 0x00020000 // Interrupt 1 from IP 4
#define INTERRUPT_IP4_BUSERR 0x00040000 // Bus error interrupt from IP 4
#define INTERRUPT_IP4_FORCE 0x00080000 // Force interrupt from IP 4
#define INTERRUPT_IP5_IREQ0 0x00100000 // Interrupt 0 from IP 5
#define INTERRUPT_IP5_IREQ1 0x00200000 // Interrupt 1 from IP 5
#define INTERRUPT_IP5_BUSERR 0x00400000 // Bus error interrupt from IP 5
#define INTERRUPT_IP5_FORCE 0x00800000 // Force interrupt from IP 5
#define INTERRUPT_IP6_IREQ0 0x01000000 // Interrupt 0 from IP 6
#define INTERRUPT_IP6_IREQ1 0x02000000 // Interrupt 1 from IP 6
#define INTERRUPT_IP6_BUSERR 0x04000000 // Bus error interrupt from IP 6
#define INTERRUPT_IP6_FORCE 0x08000000 // Force interrupt from IP 6
#define INTERRUPT_IP7_IREQ0 0x10000000 // Interrupt 0 from IP 7
#define INTERRUPT_IP7_IREQ1 0x20000000 // Interrupt 1 from IP 7
#define INTERRUPT_IP7_BUSERR 0x40000000 // Bus error interrupt from IP 7
#define INTERRUPT_IP7_FORCE 0x80000000 // Force interrupt from IP 7
CarrierName: The status bits of the other carriers are not latched. The status bits of the following carriers are all subsets of the status bits of the Pci5Ip shown below. The bit masks for each of carriers show the valid bits for each carrier.

```c
// Pci5Ip, Pci104p4Ip, cPci4Ip, cPci2Ip, Pci104pIp IP interrupt status defines
#define INTERRUPT_MASKED_A0   0x00000001  // Masked interrupt 0 from IP A
#define INTERRUPT_MASKED_A1   0x00000002  // Masked interrupt 1 from IP A
#define INTERRUPT_MASKED_B0   0x00000004  // Masked interrupt 0 from IP B
#define INTERRUPT_MASKED_B1   0x00000008  // Masked interrupt 1 from IP B
#define INTERRUPT_MASKED_C0   0x00000010  // Masked interrupt 0 from IP C
#define INTERRUPT_MASKED_C1   0x00000020  // Masked interrupt 1 from IP C
#define INTERRUPT_MASKED_D0   0x00000040  // Masked interrupt 0 from IP D
#define INTERRUPT_MASKED_D1   0x00000080  // Masked interrupt 1 from IP D
#define INTERRUPT_MASKED_E0   0x00000100  // Masked interrupt 0 from IP E
#define INTERRUPT_MASKED_E1   0x00000200  // Masked interrupt 1 from IP E
#define INTERRUPT_UNMASKED_A0 0x00000100  // Unmasked interrupt 0 from IP A
#define INTERRUPT_UNMASKED_A1 0x00000200  // Unmasked interrupt 1 from IP A
#define INTERRUPT_UNMASKED_B0 0x00000400  // Unmasked interrupt 0 from IP B
#define INTERRUPT_UNMASKED_B1 0x00000800  // Unmasked interrupt 1 from IP B
#define INTERRUPT_UNMASKED_C0 0x00001000  // Unmasked interrupt 0 from IP C
#define INTERRUPT_UNMASKED_C1 0x00002000  // Unmasked interrupt 1 from IP C
#define INTERRUPT_FORCE       0x00004000  // Forced interrupt active
#define INTERRUPT_N           0x00000080  // from any IP, bus error, or force
#define INTERRUPT_STATUS_MASK 0x007FF7FF  // Pci5Ip valid interrupt bits
#define INTERRUPT_STATUS_MASK 0x007FC7FC  // Pci104p4Ip valid interrupt bits
#define INTERRUPT_STATUS_MASK 0x004FF4FF  // cPci4Ip valid interrupt bits
#define INTERRUPT_STATUS_MASK 0x0040F40F  // cPci2Ip valid interrupt bits
#define INTERRUPT_STATUS_MASK 0x0040C40C  // Pci104pIp valid interrupt bits

Pci3Ip: The status bits for the Pci3Ip are shown below.

```c
// Pci3Ip IP interrupt status defines
#define INTERRUPT_MASKED_A0   0x00000001  // Masked interrupt 0 from IP A
#define INTERRUPT_MASKED_A1   0x00000002  // Masked interrupt 1 from IP A
#define INTERRUPT_MASKED_B0   0x00000004  // Masked interrupt 0 from IP B
#define INTERRUPT_MASKED_B1   0x00000008  // Masked interrupt 1 from IP B
#define INTERRUPT_MASKED_C0   0x00000010  // Masked interrupt 0 from IP C
#define INTERRUPT_MASKED_C1   0x00000020  // Masked interrupt 1 from IP C
#define INTERRUPT_FORCE       0x00004000  // Forced interrupt active
#define INTERRUPT_N           0x00000080  // from any IP, bus error, or force
#define INTERRUPT_UNMASKED_A0 0x00000100  // Unmasked interrupt 0 from IP A
#define INTERRUPT_UNMASKED_A1 0x00000200  // Unmasked interrupt 1 from IP A
#define INTERRUPT_UNMASKED_B0 0x00000400  // Unmasked interrupt 0 from IP B
#define INTERRUPT_UNMASKED_B1 0x00000800  // Unmasked interrupt 1 from IP B
#define INTERRUPT_UNMASKED_C0 0x00001000  // Unmasked interrupt 0 from IP C
#define INTERRUPT_UNMASKED_C1 0x00002000  // Unmasked interrupt 1 from IP C
#define INTERRUPT_BUS_ERROR   0x00004000  // Bus error 1=occurred, 0=none
```
#define INTERRUPT_STATUS_MASK 0x00007FFF  // Pci3Ip valid interrupt bits
**IOCTL_CARRIERNAME_REGISTER_EVENT**

*Function:* Registers an event to be signaled when an interrupt occurs.

*Input:* Handle to the Event object

*Output:* None

*Notes:* The caller creates an event with CreateEvent() and supplies the handle returned from that call as the input to this IOCTL. The driver then obtains a system pointer to the event and signals the event when an interrupt is serviced. The user’s interrupt service routine waits on this event, allowing it to respond to the interrupt.

**IOCTL_CARRIERNAME_FORCE_INTERRUPT**

*Function:* Causes a system interrupt to occur.

*Input:* None

*Output:* None

*Notes:* Causes an interrupt to be asserted on the PCI bus as long as the channel master interrupt is enabled. This IOCTL is used for development, to test interrupt processing.

**IOCTL_CARRIERNAME_READ_ID_PROM**

*Function:* Returns the contents of the IP ID prom for a particular slot.

*Input:* IP slot [A - H] (WCHAR)

*Output:* ID PROM contents for specified slot (ID_DATA structure)

*Notes:* Returns the contents of the requested IP ID prom. The slot [A ÷ H] is passed into this call as a Unicode character and the ID_DATA structure is returned. This structure contains two Boolean fields that indicate if the IP prom is valid (IP signature detected) and if it is capable of 32 MHz operation. It also contains a 12-element array of unsigned characters that contains the ID prom contents, provided the prom was found to be valid. See the definition of ID_DATA below.

```c
#define PROM_SZ 12  // ID Prom Size

// ID Prom Data
typedef struct _ID_DATA {
    BOOLEAN Valid;  // True if IP signature found
    BOOLEAN Clk32;  // True if IP is 32 MHz capable
    UCHAR Data[PROM_SZ];  // Prom contents
} ID_DATA, *PID_DATA;
```

**IOCTL_CARRIERNAME_RESET_ALL_IPS**

*Function:* Resets all the IP slots.

*Input:* None

*Output:* None

*Notes:* Resets all IP slots by setting and then clearing the reset_ip bit in each slot control register.
IOCTL_CARRIERNAME_IDENTIFY

Function: Flashes all user LEDs three times.
Input: None
Output: None
Notes: This call can be used when more than one IP carrier is installed in a chassis and it is desired to identify the physical location of a particular IP carrier.

IOCTL_CARRIERNAME_REINIT_IPS

Function: Re-enumerate all the IPs on the carrier.
Input: None
Output: None
Notes: All handles referencing any of the IP modules on the carrier must be closed before this call is made in order for the child device object to be updated. This call should be made after the IOCTL_CARRIERNAME_RESET_ALL_IPS call is made in order to properly initialize the device registers and stored driver values.

IOCTL_CARRIERNAME_GET_ISR_STATUS

Function: Returns the interrupt status that was read in the ISR from the last interrupt.
Input: None
Output: Interrupt status value (unsigned long integer)
Notes: Returns the status that was read in the driver Interrupt Service Routine while servicing the last interrupt. This call allows the user to see which interrupt conditions were active when the last interrupt was serviced. See the status bit definitions listed after the description of the IOCTL_CARRIERNAME_GET_INT_STATUS call.
Warranty and Repair

Please refer to the warranty page on our website for the current warranty offered and options.  http://www.dyneng.com/warranty.html

Service Policy

Before returning a product for repair, verify as well as possible that the driver is at fault. The driver has gone through extensive testing and in most cases it will be a "cockpit error" rather than an error with the driver. When you are sure or at least willing to pay to have someone help then call the Customer Service Department and arrange to speak with an engineer. We will work with you to determine the cause of the issue. If the issue is one of a defective driver we will correct the problem and provide an updated module(s) to you [no cost]. If the issue is of the customer's making [anything that is not the driver] the engineering time will be invoiced to the customer. Pre-approval may be required in some cases depending on the customer's invoicing policy.

Support

The software described in this manual is provided at no cost to clients who have purchased the corresponding hardware. Minimal support is included along with the documentation. For help with integration into your project please contact sales@dyneng.com for a support contract. Several options are available. With a contract in place Dynamic Engineers can help with system debugging, special software development, or whatever you need to get going.
